

Objective

Our CEO is a very busy person, so he needs a Schedule to track event's and where he needs to be all the time.

Your goal is to create an Agenda, so he is on track for each event and don't miss any meeting. Every meeting is described with a Title, Description and Date.

What we expect

We expect to have a fully functional Frontend in Angular 2+ (we want you to throws us some TypeScript cool stuff) where he can insert his meetings or simple check what meetings he has today, or any other day of the week. You should use Node to build an API to a MongoDB so you can persistent information.

Your layout doesn't have to be perfect, but if you have the time, please deliver us something pretty.

Bonus

- Have a calendar where he can see the meetings
- Have all the CRUD operations.
- Login screen, to increase security (use "CocusCeo" as user and password)
- Add more participants to the meeting.

Deliver

Please send us the code on a public Github repository or simply zip it and send by email to talent@cocus.com with your name and date.
